Canvas: MATTOPPTOP it may come as a shock, but not all desks were made equal. Some were made of top-grade high-end furniture and materials. Some were made of average grades of wood and metals. But some were made of plain... This book provides an overview of all major design and manufacturing techniques and helps engineers to understand how to apply them to commercial products. It presents the fundamentals of design and manufacturing so that engineers can use the process to establish a product or service in the commercial marketplace. However, the book covers a wide range of topics and techniques, including machining, prototyping, cutting and sawing processes, welding and assembly techniques, design of components and assemblies, shop design, measuring and controlling, materials, processes, and... Sheet metal fabrication, an established process in construction, has been used for centuries for the production of structural shapes that require complex geometries or robust stress environments. It is commonly used for making parts such as external body panels, hardtop, and hood. The purpose of sheet metal fabrication is to produce a semi-finished metal component, ready for subsequent processing into a finished part. This can be in one of two forms - as a single-piece sheet metal part, or as a stack of multiple sheet metal panels. A typical sheet metal fabrication process involves: 1 Drawing The sheet metal fabrication process begins with drawing the design of the component using an AutoCAD software. A designer would be required to choose the desired drawing from the library of drawing templates provided by the company. In addition to viewing the drawing and the size of the component, a template can be chosen so that there is a choice of its profile and the degree of detailing. A detail-oriented designer may also create the design template using the AutoCAD software. 1 Cutting The actual cutting of the metal is usually done by a cutter - a machine which cuts the component out of a slab of metal. Depending on the product, this is usually done by the manufacturer or... A reference to the dimensions and dimensions, to the installation, maintenance, quality and safety...
